## MB-2B Midboost/Fat Control User's Guide

The MB-2B Midboost/Fat Control boosts a wide mid-frequency range for a more distinct natural frequency boost than any other midboosts. The frequencies selected give your guitar the best response and sustain possible.

The MB-2B Midboost/Fat Control used with a strato-caster (single coil) type pickup produces a sound very similar to the old Gibson P90 pickup. Used with humbucking type pickups, the sound is transformed into that of super humbucking pickups.

The MB-2B Midboost/Fat Control produces the sound equivalent of adding 5,000 feet of wire to your pickup, and at a turn of the knob the MB-2B Midboost/Fat Control will respond by adding any amount of mid-boost you desire.

There is one control on the unit: Flat/Fat, plus a foot switch to bypass the effect, and an LED to indicate effect operation.

Flat/Fat affects the midboost/buffer which includes a wide variable gain mid-frequency power booster control and a built-in low impedance buffer.

### Input/Output

There is a 1/4" input jack on the right-hand side of the pedal, and a 1/4" output jack on the left-hand side, with a battery switch on the input jack.

### Power Supply

9 volts DC, internal or external.

Internal: 9 volt battery (for battery access, remove the four screws on the sides of the unit and pull apart). **WARNING: If battery drops below 7 volts, noise will occur.**

External: 9 volt regulated power supply, mini-plug, tip positive. Recommended external power supply is the Dunlop ECB-02.
